WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or longer, except for certain cases carded for record only (chiefly venereal disease cases treated on a duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all traumatisms other than battle casualties (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications as well as various types of wounds not due to enemy action). Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. This ratio may not be significant when the strength of a Command is changing markedly or when a Command has a relatively large number of General Hospitals.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptiness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of total beds authorized and total beds occupied.

Unless otherwise specified, beds authorized as shown in this report are defined in par. 36h of AR 40-1080, C 2. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

Regional Hospitals are distinguished from Station Hospitals by the letters (RH) appearing after the name of the station. Likewise Convalescent Hospitals are denoted by the letters (CH).

In the case of General Hospitals there are shown, in addition, the number of Army patients admitted, the number disposed of during the week (by return to duty, transfer, death, CDD, or otherwise), and the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, subdivided by disease, injury, and battle casualty patients. The patient days of treatment are presented separately for hospital and for convalescent facilities. The bed capacity and beds occupied in convalescent facilities are also indicated.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 8 SEPTEMBER 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

During the week ending 8 September 1944 the admission rate from all causes increased sharply to 573 per year per thousand strength, an increase of 10 percent over the rate for the previous week, which had recorded the lowest morbidity for any week during this war. The current week's morbidity is the highest reported since the week ending 26 May 1944.

Morbidity from all diseases combined increased notably to 503 per thousand, but remains, nonetheless, about 25 percent lower than for the corresponding week of 1943.

The current week's admission rate from injury increased sharply from the very low rate of 61 per thousand to 70 per thousand for the current week, which is approximately the level of morbidity from injury maintained during August. Current morbidity from this cause is about 20 percent lower than during the corresponding period of 1943.

Respiratory Causes:

For the second consecutive week morbidity from colds, influenza, etc. increased significantly, the current week's rate being 76 per thousand in contrast with 71 per thousand for the previous week and with a level of about 67 per thousand during July and August. Nevertheless, the admission rate for the current week is about 15 percent lower than for the corresponding week of 1943. The admission rate from pneumonia remained at 6 per thousand or about the same level as has prevailed since June.

Common Communicable Diseases:

Morbidity from venereal diseases, excluding cases contracted prior to entry into active service, increased from 34 per thousand to 38 per thousand for the current week, which is close to the relatively high experience of the last two weeks of August. Current morbidity from these causes is more than 30 percent above that for the corresponding week of 1943.

The admission rate for diarrhea and dysentery was reported at 12 per thousand or slightly higher than for the previous five weeks but considerably below the experience during the corresponding period of 1943.

The number of new cases of meningitis reported during the week increased to 23 cases and was at about the same level as during the corresponding period of 1943. The number of new cases of rheumatic fever decreased somewhat to 50 cases, or the lowest number reported during any week this year. During the current week the new cases of poliomyelitis numbered 5, as compared with 12 cases the previous week, 8 the preceding week, and 6 cases for each of the two weeks preceding.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

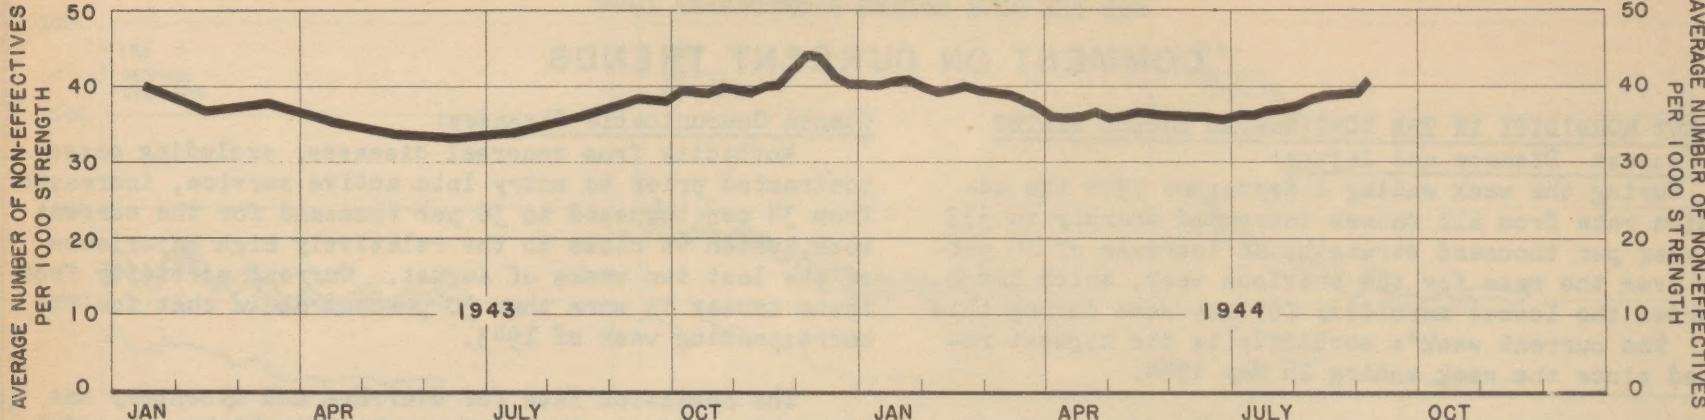

All Causes: Disease and Injury:

The admission rate from disease increased in all Service Commands except the Fifth and the Military District of Washington, where only small decreases occurred. Increases of 10 percent or more were registered in the First, Third, Fourth, and Eighth Service Commands.

The Second Service Command reported the highest morbidity from all causes (624 per thousand) and from disease (568 per thousand). The lowest morbidity from

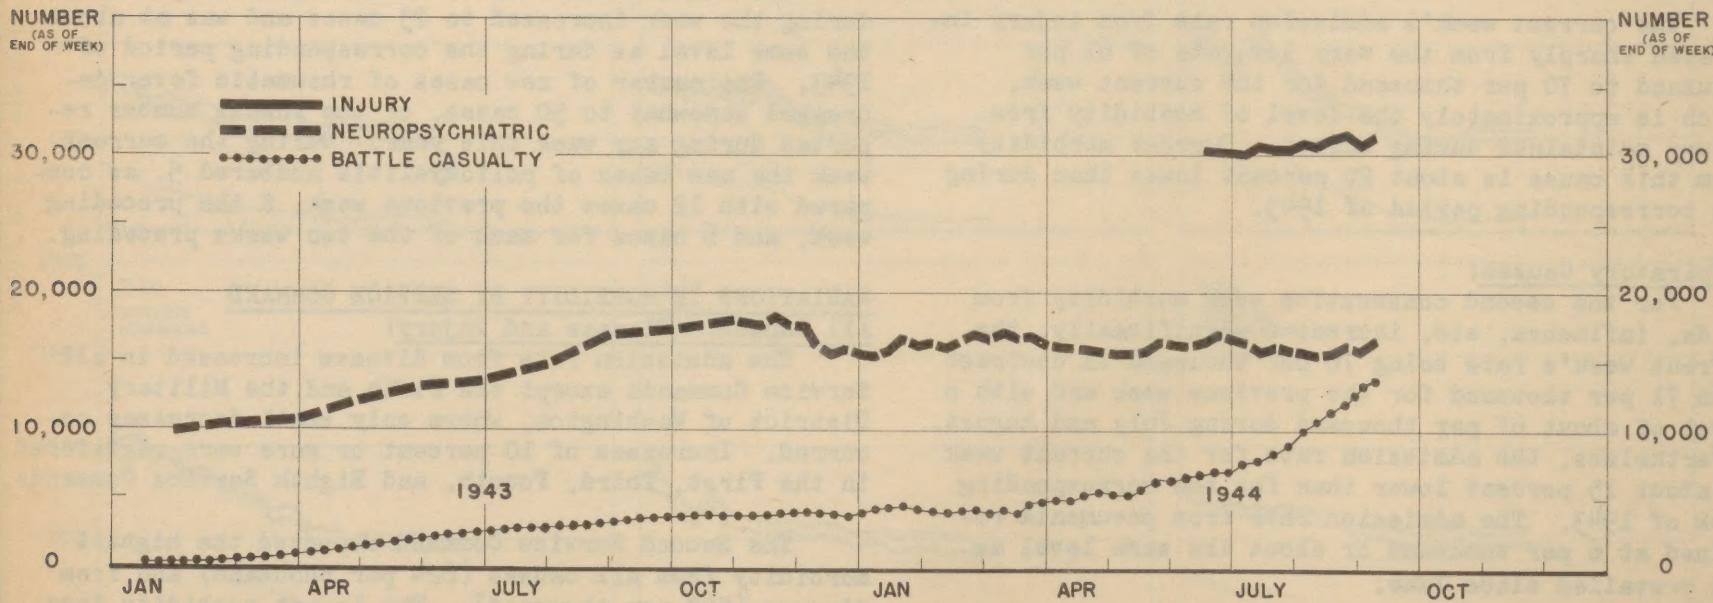

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

COMMENT ON CURRENT TRENDS (CONT'D)

all causes (526 per thousand) and from disease (455 per thousand) was reported by the Eighth Service Command which for the last 6 weeks has registered the lowest admission rate from disease.

Most Service Commands reported higher admission rates from injury; only in the First Service Command was there a sharp decrease. The largest increases were reported in the Fourth, Eighth, and Ninth Service Commands; these were caused chiefly by increased admissions at a number of large stations in each command. The Fourth Service Command, with a rate of 82 per thousand, reported the highest admission rate from injury, while the First and Sixth Service Commands, with rates of about 45 per thousand, were the lowest.

Respiratory Causes:

The admission rate from colds, influenza, etc. increased by about 30 percent in the Second Service Command (principally because of increased admissions at Camp Kilmer) and by about 10 percent in the Third, Fourth, and Eighth Service Commands. In other Service Commands morbidity from these causes was about the same as the previous week.

As a result the Second Service Command continued to report, by far, the highest morbidity from colds, influenza, etc. (128 per thousand); it was the only Command to experience a rate in excess of 80 per thousand. Only the Fourth Service Command reported a rate of less than 70 per thousand, whereas several weeks ago most of the Commands were in this category.

Morbidity from pneumonia showed remarkably little variation as between Service Commands, with all reporting rates of 5 or 6 per thousand. The Sixth Service Command, which had been experiencing rela-

tively high morbidity from this cause, for the first time reported an admission rate at about the same level as the other Service Commands.

Common Communicable Diseases:

Morbidity due to "new" venereal (excluding EPTS) cases increased in every Service Command except the Second, where only a slight decrease was reported. The greatest increases were registered in the First, Sixth, and Seventh Service Commands. The Fifth Service Command, with a rate of 60 per thousand, reported by far the highest morbidity from these causes; however, admission rates of about 50 per thousand were reported by the First and Sixth Service Commands. The lowest morbidity (18 per thousand) was reported by the Military District of Washington, while the next lowest was the Ninth Service Command (32 per thousand).

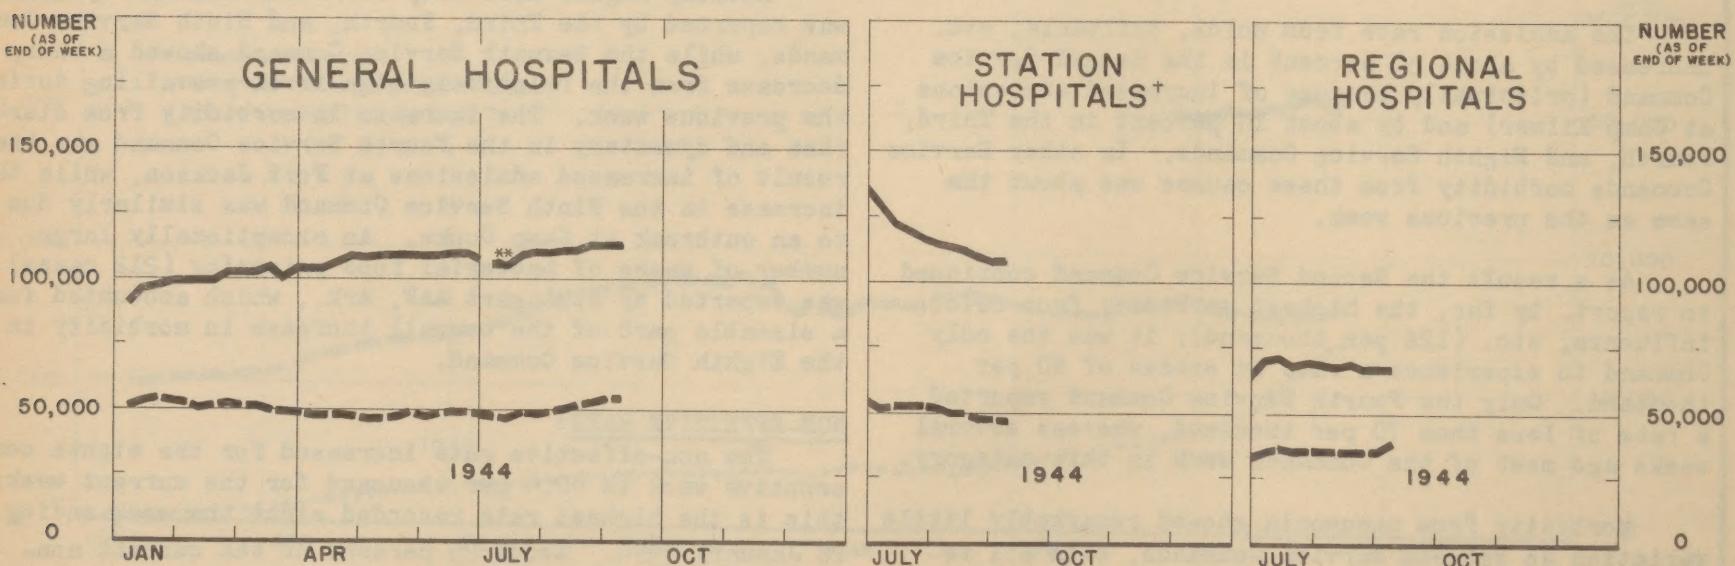

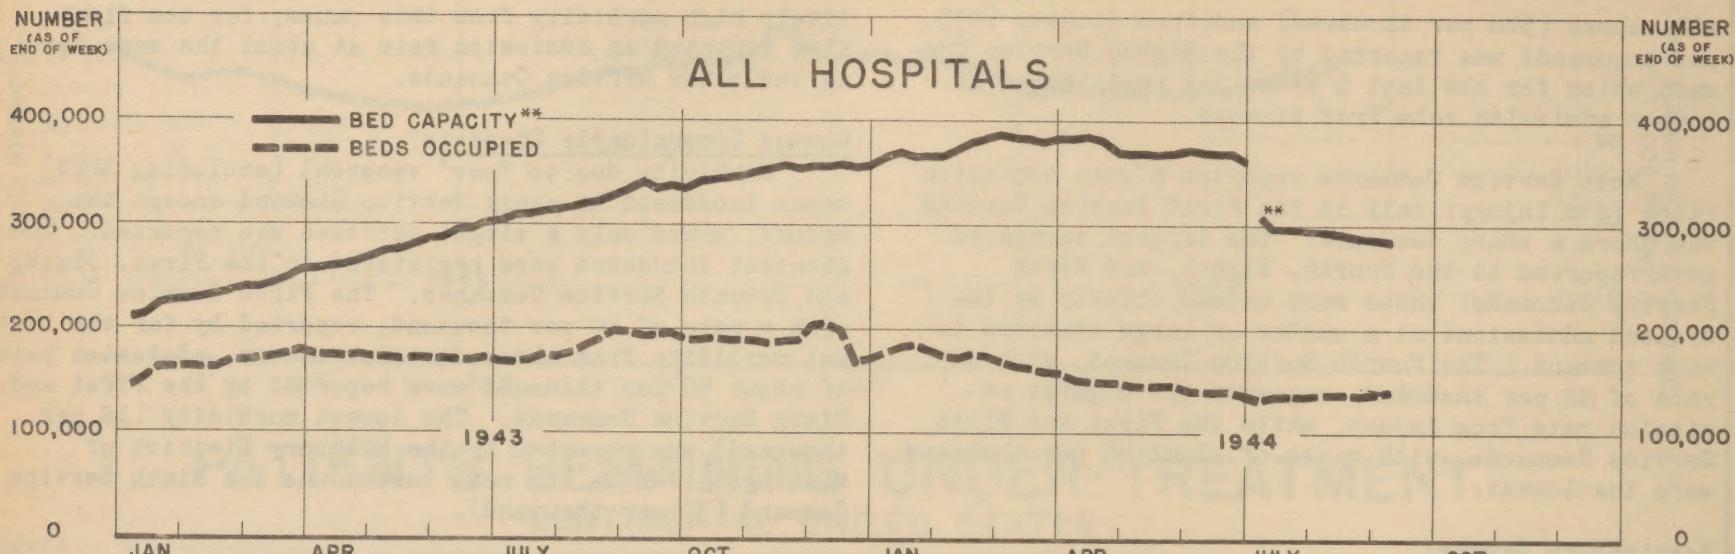

Notably higher morbidity from diarrhea and dysentery was reported by the Third, Fourth, and Ninth Service Commands, while the Seventh Service Command showed a sharp decrease from the relatively high level prevailing during the previous week. The increase in morbidity from diarrhea and dysentery in the Fourth Service Command was the result of increased admissions at Fort Jackson, while the increase in the Ninth Service Command was similarly due to an outbreak at Camp Cooke. An exceptionally large number of cases of bacterial food poisoning (212 cases) was reported by Stuttgart AAF, Ark., which accounted for a sizeable part of the overall increase in morbidity in the Eighth Service Command.

NON-EFFECTIVE RATE:

The non-effective rate increased for the eighth consecutive week to 40.4 per thousand for the current week; this is the highest rate recorded since the week ending 28 January 1944. About 25 percent of the current non-effective rate arises from days of treatment for cases evacuated from overseas theaters.

MEDICAL STATISTICS DIVISION, HEALTH REPORTS BRANCH

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week represented a rate of 39.9 per thousand strength. The number of neuro-psychiatric cases remaining as of 8 September 1944 was reported at 16,405 or about 550 more than the previous week; out of the 16,405 cases 8,185 were in General Hospitals. The number of neuropsychiatric cases remaining was at the highest point since 30 June 1944.

The number of non-battle injury patients remaining under treatment in hospital and quarters as of 8 September 1944 totaled about 31,000. The number of battle casualty patients remaining increased by about 400 to 13,650; all but 316 of these were in General Hospitals.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 8 September 1944 the total number of enlisted men discharged by CDD was 3,822 about 350 more than the previous week and the highest number recorded since such data have been reported (in July and subsequent). About 47 percent of these discharges were reported by General Hospitals.

CURRENT HOSPITAL CONDITIONS:

The total authorized beds as of 8 September 1944 numbered about 284,000 or 3,000 less than at the end of the previous week; most of this decrease occurred in the Eighth Service Command. The total number of beds occupied was 140,000 (or 49 percent of the total beds authorized) which was about 2,000 more than at the end of the previous week. Included in the total authorized beds were 255 T/O hospital beds and tentage, none of which were occupied.

The total authorized beds in General Hospitals numbered 113,306 which was slightly more than the previous week. The total number of beds occupied in

General Hospitals was 54,888 (or 48 percent of the authorized beds) which was about 700 more than at the end of the previous week and the highest number ever reported.

Station hospitals (as distinct from Regional Hospitals) reported about 104,000 total authorized beds, while Regional Hospitals reported about 67,000 beds. The number of beds occupied at station hospitals was about 47,000 or 45 percent of total authorized beds. The beds occupied at Regional Hospitals numbered about 38,000 or 56 percent of total authorized beds. Eight stations (De Ridder AAB, La., Brookley Field, Ala., Stockton Ordnance Depot, Calif., Camp Murphy, Fla., Camp Butner, N.C., Camp Callan, Calif., Fort Wayne, Mich. and Fort Baker, Calif.) reported more beds occupied than authorized beds; the first six of these were in this same category last week.

Included among the station hospitals are eleven which are designated as Convalescent Hospitals (ZI). These hospitals reported 5,666 authorized hospital beds (3,285 occupied) and in addition 11,803 beds in convalescent facilities (2,423 occupied).

The bed capacity of convalescent facilities in General Hospitals was 21,766, an increase of about 350 beds. The total beds occupied in such convalescent facilities was 7,122 or 33 percent of the total bed capacity.

On page 27 there are presented summary data for beds occupied in all General Hospitals combined as of 8 September 1944.

SUPPLEMENTARY HEALTH REPORT

CONVALESCENT FACILITIES AT REGIONAL AND STATION HOSPITALS

Data regarding convalescent facilities at Regional, Convalescent, and Station Hospitals as of 25 August 1944 are shown on page 34. Corresponding data for General Hospitals as of the same date were published in Weekly Health Report No. 34 (pages 28 to 31).

As of 25 August 1944 convalescent facilities were reported by 20 Regional Hospitals (out of a total of 56 such hospitals in operation), by 7 Convalescent Hospitals, and by 18 Station Hospitals. The total bed capacity of convalescent facilities at these 45 hospitals was 21,671; 6,508 of these beds (or 30 percent) were occupied. The convalescent bed capacity of 21,671 at these 45 hospitals is about 4,000 greater than as of 28 July 1944. Most of the increase in bed capacity is accounted for by the opening during August of Mitchell C.H. which has a capacity of 3,317 beds; 79 of these were occupied on 25 August.

In comparison with the convalescent facilities at the 45 Regional, Convalescent, and Station Hospitals, some 39 General Hospitals (out of a total of 60) reported as of 25 August 1944 a total convalescent bed capacity of 19,410; of these 6,583 (or 34 percent) were occupied. Thus, the convalescent facilities at Regional, Convalescent, and Station Hospitals had about 10 percent more convalescent facilities beds and about the same number of beds occupied than the convalescent facilities at General Hospitals.

The Ninth Service Command had the greatest number of convalescent facilities beds (about 30 percent of the U.S. total), closely followed by the Eighth and Fourth Service Commands (with 25 and 20 percent respectively).

The seven Convalescent Hospitals reported 12,620 convalescent facilities beds of which only 1,596 (or 13

percent) were occupied. Since these installations have been set up quite recently, the proportion of beds occupied is still very low but may be expected to increase steadily in the near future.

The Supplementary Report on the reconditioning program published on page 35 of this Report gives more detailed analyses of the convalescent and reconditioning at Regional, Convalescent, and Station Hospitals. However, it should be noted that many hospitals maintain reconditioning programs even though they have no buildings specially designated as convalescent facilities see par. 36b(3), AR 40-1080 for definition of this term.

During the four week period ending 25 August 1944 the number of enlisted men discharged by CDD at the Convalescent Hospitals was 154, distributed as follows:

Old Farms C.H., Conn.	—
Welch C.H., Fla.	2
Nashville AAC, Tenn.	27
Logan, Ft., Colo.	39
Albuquerque, N. Mex.	5
Geo. Wright, Ft., Oreg.	81
Mitchell C.H., Calif.	—

ARMY SERVICE FORCES, OFFICE OF THE SURGEON GENERAL
MEDICAL STATISTICS DIVISION
HEALTH REPORTS BRANCH

SUPPLEMENTARY HEALTH REPORT

CONVALESCENT AND RECONDITIONING PROGRAM DATA

Under the provisions of paragraph 36r, AR 40-1080, Changes No. 2 the numbers of Class 1, Class 2, Class 3, and Class 4 patients discharged for disability, returned to duty and remaining in convalescent and reconditioning programs are required to be reported weekly. Class 1 patients are those nearest to recovery and able to engage in fairly strenuous physical activities, Class 2 patients are in the same category but not as advanced, Class 3 are ambulant patients under treatment, and Class 4 are bedridden patients.

The data submitted during July were too incomplete to warrant summarizing. However, strenuous efforts were made to obtain more complete and accurate reporting for August, with the result that by the end of that month reports had been received from practically all hospitals with such programs.

As of 25 August 1944 the number of patients remaining in hospital (and convalescent facilities) at stations that were reporting the required data represented 95 percent of all such patients in all hospitals. The remaining 5 percent are accounted for by certain hospitals which have too few U.S. Army patients to institute such programs (e.g. Prisoners of War Camps and Ordnance Depots) as well as by stations which have not reported thus far. The stations not yet reporting are primarily in the Eighth and Ninth Service Commands; also several Transportation Corps hospitals have not set up reconditioning programs.

Because of the newness of the reporting program and the failure to obtain complete reporting in August from many stations, it was necessary to make approximations and adjustments in presenting the overall picture. Thus, where reports had not been received for all weeks in August the data for the missing period were estimated on the basis of the reported data.

Some reports included data for other than Army personnel who were in the reconditioning program, so that it was necessary to make adjustments to exclude such personnel.

In the following tables are listed separately within each Service Command, for each General Hospital, each other ASF hospital, and each AAF hospital (1) the total Army patients remaining at the end of the period (25 August 1944), (2) the total number discharged with Certificate of Disability for Discharge (CDD) during the four week period ending 25 August, and (3) the number returned to duty during this period. The number of Class 1, Class 2, Class 3 and Class 4 patients as well as the total number in the reconditioning program are shown for each station. It should be noted that the reconditioning programs are generally in effect throughout the hospital and are not confined to the convalescent facilities in those stations that have both hospital beds and convalescent facilities beds.

For the total United States 71 percent of the total patients remaining in hospital as of 25 August were participating in the reconditioning program. In the General Hospitals, which accounted for almost one-half of the total patients, the corresponding figure was 73 percent, while for other ASF hospitals and for AAF hospitals the figures were 64 percent and 76 percent respectively.

The proportion of total patients participating in the reconditioning program varied widely as between Service Commands. The lowest proportion (54 percent) was in the Military District of Washington, with the Fifth and Eighth Service Commands having the next lowest proportions (both slightly less than 65 percent). On the other hand, the highest proportion (89 percent) was reported for the Second Service Command, followed

CONVALESCENT AND RECONDITIONING PROGRAM DATA (CONT'D)

by the First Service Command (85 percent).

For the United States as a whole the patients remaining in the reconditioning program were reported as subdivided by classes as follows:

	<u>Total</u>	<u>Class 1</u>	<u>Class 2</u>	<u>Class 3</u>	<u>Class 4</u>
Total U.S.	100%	9%	15%	45%	31%
Gen. Hospitals	100	4	12	56	28
ASF Hospitals	100	10	15	40	35
AAF Hospitals	100	19	21	28	32

From this it may be seen that General Hospitals tended to have slightly more patients in Class 3 and slightly fewer in the other Classes (particularly Class 1) than for the United States as a whole. The other ASF hospitals had relatively fewer patients in Class 3, while for AAF hospitals there were decidedly more patients in Classes 1 and 2 and fewer in Class 3. This may reflect to some extent differences in classification of patients as between AAF and other hospitals, since many of the former had reconditioning programs some time before such were instituted on an Army wide basis. All three types of hospitals show about the same proportions in Class 4.

The distribution of patients remaining by Class varied considerably by Service Command. The highest proportion of Class 4 patients was reported by the Sixth Service Command (43 percent), while the lowest was reported by the First Service Command (21 percent). In respect to Class 3 patients, the highest proportion was reported by the First Service Command (67 percent), while the lowest was the Fourth, Sixth, and Eighth Service Commands, all of which showed about 40 percent. The highest proportion of Class 2 patients was reported by the Third Service Command (22 percent), while the lowest was in the First Service Command (6 percent). In respect to Class 1 patients, both the Fourth and Eighth Service

Commands reported the highest proportions (about 15 percent), while the lowest was in the Second, Third, and Sixth Service Commands (about 4 percent).

Patients returned to duty from the reconditioning program quite naturally came primarily from the first two classes; the distribution by class was as follows: Class 1-39 percent, Class 2-22 percent, Class 3-31 percent, and Class 4-8 percent. These proportions were about the same for General Hospitals, other ASF hospitals, and AAF hospitals, except that the General Hospitals reported a somewhat smaller proportion of those returned to duty from Class 4 (only about 4 percent), while AAF hospitals showed relatively few of those returned to duty from Class 3 and relatively many from Class 1 (about 50 percent).

Of the patients in the reconditioning program who were discharged with CDD's during the four week period 63 percent were from Class 3, with the remaining 37 percent being divided as follows: Class 4-15 percent, Class 2-14 percent, and Class 1-8 percent. In General Hospitals 72 percent of those discharged with CDD's were from Class 3 and only 11 percent from Classes 1 and 2 combined.
